

2018 Cotton Variety Testing Results

The University of Arizona
Cooperative Extension

Introduction

Variety selection is one of the most important decisions a grower will make contributing to the success of a cotton crop. It is critical, that a grower have as much information as possible in order to make an informed decision regarding variety selection.

In an effort to help supply reliable variety performance information, the University of Arizona conducts a statewide Upland cotton variety testing program. This program consists of a few different types of trials. The first is a small plot evaluation of commercially available varieties along with experimental varieties and is conducted in 3 locations across Arizona including; Yuma, Maricopa, and Safford. This testing program is called the University of Arizona Upland Cotton Advanced Strains Testing Program.

Another type of University sponsored trial is a large plot, replicated strip trial conducted on grower cooperator farms in a wide variety of locations across Arizona. These large plot strip trials consist of replicated plots extending the full length of the irrigation run at each location. This program is titled the University of Arizona Upland Cotton Variety Testing Program (UCVT). Seven locations across the state were conducted in 2018.

Testing of commercial and experimental ELS (Pima) varieties were also conducted in 3 locations in 2018. Two of the locations were small plot trials, while the third was a strip trial conducted on a grower cooperator field.

The following three tables contain location, planting date, early and mid-season data collection dates, final irrigation date, initial defoliation date, harvest date, soil type, and irrigation technique, for each of the trials conducted across Arizona in 2018. The remainder of the tables in this publication contain yield and fiber quality data for each of the locations. Statistical analysis for all parameters is also presented at the bottom of each table. Also included are early season data of stand count and vigor ratings along with mid-season data including plant height and nodes above white flower (NAWF) at mid - peak bloom. For each location a figure plotting lint yield as a function of fiber premium/discount is presented. The vertical line in the figure represents the average of the trial for fiber premium and the horizontal line represents the trial average for yield. Any varieties falling in the upper right quadrant performed better than average for both lint yield and fiber quality at that location.

If you have any questions regarding these trials or this publication please direct them to Dr. Randy Norton, Regional Extension Specialist and Director of the Safford Ag Center at rnorton@cals.arizona.edu.

The work performed over the course of the 2018 cotton season to produce the results contained in this booklet was funded in part by Cotton Incorporated through the Arizona Cotton Growers Association and also by participating seed companies. A special Thank You is extended to the Grower-Cooperators who participate in these testing programs. This program would not be successful without them.

Team Members

Randy Norton, editor
