Introduction

Variety selection is one of the most important decisions a grower will make contributing to the success of a cotton crop. It is critical, that a grower have as much information as possible in order to make an informed decision regarding variety selection. In an effort to help supply reliable variety performance information, the University of Arizona conducts a statewide cotton variety testing program. This program consists of a few different types of trials. The first is a small plot evaluation of commercially available varieties along with experimental varieties and is conducted in 3 locations across Arizona including Yuma, Maricopa, and Safford. This testing program is called the University of Arizona Upland Cotton Advanced Strains Testing Program.

Another type of University sponsored trial is a large plot, replicated strip trial conducted on grower-cooperator farms in a wide variety of locations across Arizona. These large plot strip trials consist of replicated plots extending the full length of the irrigation run at each location. This program is titled the University of Arizona Upland Cotton Variety Testing Program (UCVT). Seven locations across the state were conducted in 2020.

Testing of commercial and experimental ELS (Pima) varieties were also conducted in 3 locations in 2021. Two of the locations were small plot trials (Pima Cotton Advanced Strain Testing Program – PCAST), while the other location was a strip trial conducted on a grower cooperator field (Pima Cotton Variety Testing Program – PCVT).

Each trial is summarized in this publication with a series of tables and graphs. The first table contains location, planting date, along with various other location characteristics for each of the trials conducted across Arizona in 2021. The second table for each location contains early season data collected including early season stand count (plants per foot) and plant vigor rating (1-9 low-high). The second table also contain mid-season data collected including nodes above white flower (NAWF) for a measurement of relative earliness and plant height (inches). The third table for each location contains yield and fiber quality data. Statistical analysis for all parameters is also presented at the bottom of each table. Finally, for each location a figure plotting lint yield as a function of fiber premium/discount is presented. The vertical line in the figure represents the average of the trial for fiber premium and the horizontal line represents the trial average for yield. Any varieties falling in the upper right quadrant performed better than average for both lint yield and fiber quality at that location.

If you have any questions regarding these trials or this publication please direct them to Dr. Randy Norton, Regional Extension Specialist and Director of the Safford Ag Center at rnorton@cals.arizona.edu.

The work performed over the course of the 2021 cotton season to produce the results contained in this booklet was funded in part by Cotton Incorporated through the Arizona Cotton Growers Association and also by participating seed companies. A special Thank You is extended to the Grower-Cooperators who participate in these testing programs. This program would not be successful without them.

*Lint yield means followed by the same letter are not statistically different according to Fisher's LSD (Least Significance Difference) means separation ($\alpha = 0.05$)

**Value calculated from CCC loan schedule base price of \$0.52/lb + premium/discount

§Least Significant Difference

†Observed Significance Level

‡Coefficient of Variation

Lint yield (lbs./acre) plotted as a function of fiber quality premium/discount (cents/lb) for the top third (A), middle third (B), and bottom third (C). Vertical and horizontal lines represent the mean value for the two parameters. Varieties that fall in the upper right quadrant formed by the mean lines produced higher than average lint yield and fiber quality. Each entry for the Upland Advanced Strain evaluation is plotted for the Yuma, AZ location in 2021.

Early season emergence (plants/foot), vigor evaluations (1-9, L-H) for each entry in the Upland Advanced Strain evaluation, Maricopa, AZ, 2021.

**Value calculated from CCC loan schedule base price of \$0.52/lb + premium/discount

§Least Significant Difference

†Observed Significance Level

‡Coefficient of Variation

Lint yield (lbs./acre) plotted as a function of fiber quality premium/discount (cents/lb) for the top third (A), middle third (B), and bottom third (C). Vertical and horizontal lines represent the mean value for the two parameters. Varieties that fall in the upper right quadrant formed by the mean lines produced higher than average lint yield and fiber quality. Each entry for the Upland Advanced Strain evaluation is plotted for the Maricopa, AZ location in 2021.

Agriculture, Life &
Veterinary Sciences &
Cooperative Extension

Early season emergence (plants/foot), vigor evaluations (1-9, L-H), and mid-season plant height and nodes above white flower (NAWF) for each entry in the Upland Advanced Strain evaluation, Safford, AZ, 2021.

Lint yield (lbs./acre) plotted as a function of fiber quality premium/discount (cents/lb) for the top third (A), middle third (B), and bottom third (C). Vertical and horizontal lines represent the mean value for the two parameters. Varieties that fall in the upper right quadrant formed by the mean lines produced higher than average lint yield and fiber quality. Each entry for the Upland Advanced Strain evaluation is plotted for the Safford, AZ location in 2021.
