Stress Management After a Disaster

Promoting the Health and Well-Being of Families During Difficult Times

Marta Stuart, Extension Specialist
Yavapai County, Arizona

The purpose of this fact sheet is to introduce information on the symptoms of stress, and how individuals can effectively manage their stress. Everyone experiences stress on a daily basis. We experience positive stress when we are excited about something important or interesting that happens in our lives such as getting a new job, getting married, buying a new home, winning the lottery, going on vacation, and meeting new and exciting people. These experiences prompt us to take action.

We experience negative stress when a sudden or disagreeable event or disaster occurs such as the loss of a farm due to disaster, drought, tornado, hurricane, decreasing farm market prices, pest infestation, or fire. Disasters can cause traumatic stress. Negative stress may also occur in response to death, personal injury, illness or divorce. Too many stressful events can cause extreme stress. Too much stress will result in physical or emotional reaction. Everyone reacts to stress differently; what one individual sees as very stressful may not be stressful for another individual. Individual differences play a major role in how well we handle stressful situations.

What Is Stress?

Stress is the “wear and tear” our bodies experience as we adjust to our continually changing environment. According to Hans Selye, a pioneer researcher in stress reaction, “stress is the human response to changes that occur as a part of daily living.” Stress has a physical and emotional effect on us, and it can create positive or negative feelings. “Stress comes from any situation or circumstance that requires behavioral adjustment. Any change, either good or bad, is stressful, and whether it’s a positive or negative change, the physiological response is the same” (Lazarus, 2000).

Symptoms of Stress

When you are stressed, your body creates extra energy to protect itself, which then creates an imbalance within your system. This energy needs to be directed into responses to regain a sense of balance. The American Psychological Association (APA) identifies four different types of stress: acute stress, episodic acute stress, chronic stress, and traumatic stress. Here is a summary of the symptoms for each type of stress (Lazarus, Stress Relief & Relaxation Techniques, Pages 10-17):

Level 1 - Acute Stress

Stressors defined as acute are the things that hamper your plans or your day: transportation problems that make you late to work, a missed deadline, an unexpected meeting with your child’s teacher. Acute stress happens to everyone and tends to be manageable.
Symptoms of Acute Stress:
- Emotional distress: worry, anger, irritability, anxiety, frustration, impatience
- Physical problems: fatigue, headache, back pain, jaw pain, trembling, cold hands and feet, and muscular stiffness that can lead to pulled muscles, tendons, and ligaments
- Digestive problems: heartburn, acid stomach, diarrhea, constipation, flatulence, irritable bowel syndrome
- Vital-Sign disturbances: rise in blood pressure, rapid heartbeat, sweaty palms, heart palpitations, dizziness, shortness of breath, chest pain
- Mental disturbances: confusion, inability to concentrate, indecisiveness, mind racing, mindlessness, or blankness

**Level 2 - Episodic Acute Stress**
Episodic acute stress is characterized by intense reaction to everything: the classic type A personality, an excessive competitive drive, aggressiveness, impatience, and having a sense of time urgency. Episodic acute stress involves worry that a disaster is going to happen any minute.

Symptoms of Episodic Acute Stress (In addition to symptoms of acute stress):
- Persistent headaches
- Hypertension
- Asthma
- Chest pain
- Heart disease

**Level 3 - Chronic Stress**
Chronic stress is the long-standing stress that wears people down. It can be associated with such problems as poverty, illness, dysfunctional families, or work dissatisfaction.

Symptoms of Chronic Stress:
- Loss of appetite, or overeating
- Feeling of insecurity & inadequacy
- Weakened immune system
- Heart disease
- Chronic pain in joints, back, jaw, or shoulders
- Pessimism
- Resentment
- Extreme or chronic anger
- Inability to concentrate
- Peptic ulcers
- Diminished coping ability
- Depression
- Chronic fatigue
- Migraine headaches
- Persistent anxiety
- Reclusiveness
- Constant irritability
- Cynicism
- Low performance levels
- Digestive Disorders

**Level 4 - Traumatic Stress**
Traumatic stress occurs when a person has had a traumatic experience such as being in an accident, witnessing a terrible crime, losing a job, or having extreme financial problems in keeping the farm as a result of a drought or any natural or human disaster. Individuals experience extreme emotional responses. The shock can make you dazed and the denial is the coping mechanism – putting off feeling the intensity of the experience.

Symptoms of Traumatic Stress:
- Feelings: unpredictable, intense mood swings; anxiety; nervousness; depression
- Thoughts: flashbacks; vivid memory of event; inability to concentrate
- Physical reactions: rapid heartbeat; sweating; headache, nausea, chest pain, general pain, and digestive problems
- Relationship problems: strained, frequent arguments with family members and/or coworkers; withdrawal and isolation from group activity

**Coping Skills**
What can we do to cope with stress in our lives? “Coping reflects thinking, feeling, or acting so as to preserve a satisfied psychological state when it is threatened. Coping is typically not a single response, but a series of responses, initiated and repeated as necessary to handling the remaining, continuing, or transformed nature of the stressor” (Synder, page 4).
### Practical Coping Skills
